Connector Endpoints

Connectors · https://2yetis.net/docs/connector-endpoints/

Connectors are endpoints that receive / collect data from sources and then send it to the corresponding adapter which is associated to the connector by sharing the same dispatcher ID. 2Yetis provides a set of out of the box connector. As mentioned in the introduction connectors are light weight modules that focus on receiving collecting data from a source. If your source is not covered by a connector shipped by 2yetis, please contact us and we will be happy to help you getting you source integrated.
